SMARTATTEND

Customer Journey Map

How an administrator uses SmartAttend to manage classroom attendance

Project documentation • Requirement Analysis

Prepared for an AI-assisted attendance management application

1. Purpose

This map describes the expected end-to-end journey for the primary user: an administrator or instructor who uses SmartAttend to create or review attendance records. It is based on the visible admin-oriented dashboard and the stated attendance use case.

2. Customer journey

Stage	User action	Touchpoint	User need / expectation	Potential pain point	Opportunity
1. Access	Opens the application and signs in as Admin	Login screen	Secure, straightforward access	Credentials are missing or unclear	Provide setup instructions and clear login errors
2. Start session	Chooses the attendance workflow or class/session	Admin dashboard	Know what to do next	Unclear navigation or missing class data	Show a prominent start/select-session action
3. Provide input	Uploads classroom media or uses a supported capture method	Upload / capture interface	Accepted formats and size are clear	Unsupported file, large file, poor lighting	Validate file type/size and show helpful guidance
4. Process	Starts attendance analysis and waits for results	Processing status	Progress and meaningful feedback	Long processing or face not detected	Show progress, warnings and retry guidance
5. Review	Checks detected people and attendance status	Results / attendance table	Results can be reviewed before finalizing	False match or missed person	Allow manual review/correction where supported
6. Save / export	Saves or exports the session record if feature is available	Attendance history / export	Records are traceable and reusable	Unclear save state or no export option	Show confirmation, timestamp and export controls
7. Follow up	Returns to history to inspect a previous session	History / reports	Quickly find past attendance	Difficult filtering or missing history	Add search, date filters and summary metrics

3. Success measures

- The administrator can reach the attendance workflow without assistance.
- The system clearly communicates whether media was accepted and processing completed.
- Attendance results can be reviewed before being relied on.
- Any saved record is associated with a session/date and can be found again, if history storage is implemented.

4. Assumptions and scope note

This is a proposed journey map, not a claim that every step is already implemented. Verify the current repository before presenting save, export, history, webcam, or manual-correction capabilities as completed features.
